<https://schneider-joachim.github.io/ist363/unit4/lab4/index.html>

Yes- you're right, I forgot to edit the corrected pages for lab 3. Unsure if its too late but it should be reflected after this.

WARMUP

You may not use artificial intelligence to answer the questions below.

- 2.

- a.

.navbar-toggler creates the button (hamburger icon) that appears on smaller screens. It allows users to toggle (show or hide) the navigation menu.

.collapse is used to hide and show the navigation items. It works with **.navbar-toggler** so the menu collapses on smaller screens and expands when the toggle button is clicked.

Navigation items can be aligned to the right by using the Bootstrap utility class **ms-auto** on the navigation container, such as the `<ul>` element. This class automatically applies margin to push the navigation items to the right side of the navbar.

- b.

Bootstrap has these button sizes:

Small button:

`btn btn-sm`

Default button:

`btn`

Large button:

btn btn-lg

Example of how they're used:

```
<button class="btn btn-primary btn-sm">Small</button>
```

```
<button class="btn btn-primary">Default</button>
```

```
<button class="btn btn-primary btn-lg">Large</button>
```

c.

Gutters in Bootstrap are the spaces between columns in the grid system. Their default behavior is to automatically provide consistent spacing between columns both horizontally and vertically. This spacing helps improve layout readability and visual organization without requiring additional CSS.

A **block button** is a button that takes up the full width of its parent container. This type of button is useful in situations such as forms, mobile layouts, or call to action sections where a larger, more noticeable button improves usability and accessibility.
